

Here's a step-by-step guide for downloading, running, building, and publishing a React Native mobile app from a GitHub repository.

1. Clone the Repository

Open a terminal or command prompt and run the following command to clone the repository:

```
git clone https://github.com/Adappt-Intelligence-Inc/libra.git
```

Navigate to the cloned repository directory:

```
cd libra  
cd Addapt_Mobile_App_Code
```

2. Install Dependencies

Make sure you have Node.js and npm installed. Then, install the necessary dependencies by running:

```
npm install
```

If your project uses Yarn, you can install dependencies using:

```
yarn install
```

3. Run the App Locally

For iOS:

- Navigate to the `ios` directory:

```
cd ios
```
- Install iOS dependencies:

```
pod install
```
- Go back to the root directory:

```
cd ..
```
- Start the Metro bundler:

```
npx react-native start
```

- In another terminal, run the app on the iOS simulator:
`npx react-native run-ios`

For Android:

- Ensure that you have an Android emulator running or a physical device connected.
- Start the Metro bundler if it's not already running:
`npx react-native start`
- Run the app on the Android device:
`npx react-native run-android`

4. Build the App for Production

iOS:

- Open the Xcode workspace:
`open ios/YourProjectName.xcworkspace`
- Select your target device or simulator in Xcode.
- Go to **Product > Archive** to create a build.
- After the build is complete, you can distribute the app using the Xcode Organizer.

Android:

- Generate a release APK by running:
`cd android`
`./gradlew assembleRelease`
- The release APK will be located in `android/app/build/outputs/apk/release/`.

5. Publish the App

iOS (App Store):

- Log in to your Apple Developer account.
- Use Xcode's Organizer to upload your archive to App Store Connect.
- Follow the steps in App Store Connect to create a new app, provide necessary details, and submit the app for review.

Android (Google Play Store):

- Log in to your Google Play Console.
- Create a new application if you haven't already.

- Upload the generated release APK.
- Complete the store listing, content rating, and pricing & distribution sections.
- Submit your app for review.

6. Managing Version Control

Ensure that you update version numbers in both `package.json` and native files (`Info.plist` for iOS and `build.gradle` for Android) as needed before building and publishing.
